

MERHABA

Junior Developer Selection Brief

Welcome

Thank you for your interest in joining **Merhaba**. This selection exercise is designed to evaluate how you approach building software in an AI-assisted environment — the same way we work every day.

We care less about perfect code and more about clear thinking, deliberate decisions, and your ability to understand and own the system you produce.

What We Are Assessing

- Your ability to use AI tools productively while remaining in control of the outcome
- Understanding of core software engineering concepts (architecture, data modelling, auth, state, trade-offs)
- Capacity to explain and defend technical decisions
- Judgment in accepting, modifying, or rejecting AI-generated suggestions

The Assignment

Build a small but complete web application that Merhaba could realistically use internally. Keep the scope tight — quality of thinking matters far more than number of features.

Project name suggestion: Welcome Notes (or any sensible name you prefer)

Required Features

1. Users can create short notes with a title and body (these can represent onboarding messages, client greetings, or internal announcements).
2. Ability to list, view, edit, and delete notes.
3. Basic authentication (you choose the approach — email/password, magic link, or another sensible method).
4. One additional feature of your choice that you believe would be useful for a company like Merhaba. You must be ready to explain why you chose it.

Technical Guidelines

- You may (and should) use any AI tools freely — Cursor, Claude, ChatGPT, Copilot, etc.
- Use a real programming stack. Preferred direction: TypeScript + React or Next.js + a real database. Other solid stacks (Node, Golang, etc.) are also acceptable.
- The application must be deployed and publicly accessible (Vercel, Railway, Render, Fly.io, or equivalent).
- Code should be in a public GitHub repository (or a private repo you share with us).

We are not looking for production-grade perfection. We are looking for clear structure, sensible decisions, and evidence that you understand what you built.

Deliverables

Item	Details
Live URL	Publicly accessible working application
GitHub Repository	Source code with a clear README
README Content	Architecture overview + what AI helped with vs. decisions you made yourself

Timeline

You have **5–7 days** from the date you receive this brief. If you need a short extension for a legitimate reason, simply let us know in advance.

What Happens Next

After you submit, we will schedule a short technical conversation (approximately 40–50 minutes). During that call we will walk through the code together and discuss the decisions you made. Be prepared to explain the architecture, key flows, and any places where you deliberately changed or rejected AI suggestions.

This conversation is the most important part of the selection. We want to understand how you think.

We look forward to seeing how you approach this. Good luck — and enjoy building.
